YOUR AMBIENT PROFILE

Early Measurement Across All Domains.

Every domain has moved from awareness to data. None has been pushed to validated, actionable impact yet. The measurement foundation is in place – the question is which domain gets pushed first.

Two or more years live with mixed maturity. Some domains are yielding confirmed value; others have been generating returns that no one has looked at yet. At this tenure, that's a prioritization problem, not a knowledge problem.

WHAT THIS ASSESSMENT FOUND

WHAT THE MATH SHOWS

\$402K

per year from measured domains

WHAT HASN'T BEEN MEASURED

\$50K-150K

per year benchmark range

DEPLOYMENT

Providers	50
Encounters	80,000/yr
Utilization	40%

The first number is what the math shows based on your data and stated assumptions. The second is a benchmark range that organizations your size typically find when they analyze domains they haven't measured yet. Not a projection for your organization.

MATURITY POSITION

2+ years in deployment, and your organization is measuring across some domains with real results. The gap is in the domains that haven't been formally analyzed yet. At this tenure, that's not an adoption question — it's a prioritization question. Your organization is beginning to capture ambient ROI, but Capacity and Revenue and Workforce and Quality remain in early stages. Your biggest opportunity is in quality — documentation quality improved but no downstream teams have been engaged.

DOMAIN BREAKDOWN

Capacity 12 / 25
L2 — Access Decision Made

Revenue 12 / 25
L2 — Directional Signal

Workforce 12 / 25
L2 — Burden Measured

Quality 4 / 25
L1 — Improvement Untracked

TOTAL 40 / 100

CAPACITY

Access Decision Made

Recovered time is ambient's most universal output. The strategic divide is between organizations that measure it and stop — and organizations that assign it a destination. Capacity measures that decision.

WHERE YOU STAND

Leadership is planning how to convert recovered time into patient access. Scheduling or template changes are being scoped.

\$0 deployed. The value at this level is the decision itself — not dollars.

MEASURED IMPACT

Access decision: Planning

NEXT LEVEL UNLOCKS

Confirmed additional patients per provider per month attributed to recovered time, with access revenue calculated.

IMPACT

Not yet calculated

YOUR INPUTS

Access decision stage

Planning

A THOUGHT ON THIS

The organizations moving fastest from Level 1 to Level 3 share one thing: they scheduled the operational conversation — with a recommendation in hand — before they thought they were ready. The number doesn't need to be perfect. It needs to be in the room.

MATURITY LEVEL

Level 2 of 4

REVENUE

Directional Signal

\$192K
per year

Every encounter is coded. The question is whether it's coded at the specificity your documentation now supports — and whether your revenue cycle team is part of that conversation. Organizations that close that loop find it is worth millions. Most haven't asked the question yet.

WHERE YOU STAND

Your organization estimates 1–3% of encounter revenue is being affected by documentation improvements.

At 32,000 documented encounters × \$200 per visit:

1.0% = \$64K

3.0% = \$192K

This is your team's directional estimate based on trending data. A formal before/after analysis (Level 3) would validate this figure.

3 areas showing movement:

wRVU per encounter trending upward, Denial rates trending downward, Collections per encounter trending upward

MEASURED IMPACT

\$64K–\$192K directional estimate

NEXT LEVEL UNLOCKS

A formal before/after analysis that produces a number revenue cycle leadership can stand behind.

Estimates based on your inputs. Individual results vary.

CALCULATED IMPACT

\$192K
per year

YOUR INPUTS

Areas showing movement	wRVU trending up, Denial rates trending down, Collections trending up
Directional estimate	1–3%

HOW WE GOT HERE

[lowEstimate] = 32,000 × \$200 × 1.0% = \$64K
[highEstimate] = 32,000 × \$200 × 3.0% = \$192K

A THOUGHT ON THIS

The revenue cycle team almost always finds something when they look. The barrier isn't data — it's the first conversation. Organizations that formalize that conversation within 90 days of deployment typically have a number before their first contract renewal.

MATURITY LEVEL

Level 2 of 4

Burden Measured

\$210K
per year

Provider burnout is one of the most expensive problems in health system operations — and ambient documentation is one of the few interventions that measurably addresses it. The value only becomes visible when someone is looking for it.

WHERE YOU STAND

At 4% annual turnover across 50 providers, your organization sees approximately 2.0 departures per year.

Replacement cost: Using AMGA benchmark midpoint: \$350K.
Total turnover cost is \$700K annually.

Of that, your estimate of 30% attributable to documentation burden represents \$210K — the portion potentially attributable to documentation burden reduction.

MEASURED IMPACT

\$210K in
documentation-attributable
turnover exposure.

NEXT LEVEL UNLOCKS

Modeling turnover costs with documentation burden as a contributing factor — connecting provider experience data to retention economics.

All inputs are your organization's data. No external correlation estimates applied.

CALCULATED IMPACT

\$210K
per year

HOW WE GOT HERE

$[\text{annualDepartures}] = 50 \times 4\% = 2.0$
 $[\text{totalCost}] = 2.0 \times \$350\text{K} = \$700\text{K}$
 $[\text{docDriven}] = \$700\text{K} \times 30\% = \210K

A THOUGHT ON THIS

Provider experience is the most politically powerful data in a health system — and it's consistently under-quantified. Organizations that formalize this measurement tend to use it in ways they didn't initially plan: recruitment, contracts, board presentations.

MATURITY LEVEL

Level 2 of 4

QUALITY

1 Improvement Untracked

NOT YET MEASURED

Improved notes are the starting point. The real value depends on whether that improvement reaches CDI, coding, quality reporting, compliance, and future AI initiatives. This domain measures how far downstream the documentation improvement has traveled.

WHY THIS DOMAIN MATTERS

32,000 encounters with improved documentation.

Downstream connection not yet started. The value of improved documentation depends on whether coding, quality reporting, compliance, and other teams can see and use the improvement.

BENCHMARK RANGE

\$50K–\$150K

in downstream quality and compliance value, annually

Benchmark range based on organizations your size. Not a projection for your organization.

WHAT MAY ALREADY BE ON THE TABLE

At your scale, Quality has been generating approximately \$50K–\$150K per year for 2+ years. That's approximately \$125K–\$375K

in cumulative value that has existed, at minimum, without being formally counted.

Approximate range. Not a projection for your organization. Actual results vary.

NEXT LEVEL UNLOCKS

Systematic tracking of documentation quality attributes — completeness, specificity, compliance readiness, and risk adjustment capture.

Estimates based on your inputs. Individual results vary.

BENCHMARK RANGE

\$50K–\$150K

typical range at your scale — not a projection

YOUR INPUTS

Downstream connection

Not yet

A THOUGHT ON THIS

The downstream value of better documentation compounds — but only when someone connects the improvement to the teams that depend on it. CDI, coding, quality reporting, and compliance teams need to see the change. That connection, formally structured, is the Level 1 to Level 2 move.

MATURITY LEVEL

Level 1 of 4

The organizations that move from Acting to Level 3+ across multiple domains in under 12 months don't do it alone.

What they have in common is that the domains they've measured have given them leverage. The signal you've built is real. The organizations that move quickly from here use that signal to accelerate the unmeasured domains — not one at a time, but as a connected program. The measurement infrastructure you've started is the hardest part to build from scratch. You're not starting from scratch.

At 2+ years, the conversation is different. It's not about building measurement habits. It's about what's been sitting on the table — and what it takes to count it this year.

WHAT THE DATA SHOWS

LEVEL 3 REVENUE WITHIN 12 MONTHS

Organizations that get there have a structured CDI and coding review process connected to their ambient documentation — not a one-time study, but an ongoing program.

LEVEL 3 WORKFORCE WITHIN 12 MONTHS

Organizations that get there have a formal provider satisfaction measurement program running on a cadence — explicitly connected to ambient data.

THE COMMON THREAD

Measurement infrastructure that was built, not discovered. The organizations that close the gap quickly don't stumble into it — they built a program.

DOMAIN PRIORITIES

- 1

Quality \$50K-\$150K benchmark range UNMEASURED

Begin tracking documentation completeness, specificity, and accuracy at scale — the foundation CDI, coding, and compliance all depend on.
- 2

Capacity

Complete a patient volume measurement that confirms how many additional patients are actually being seen per provider per month.
- 2

Revenue \$192K

Complete a formal before/after analysis that produces a dollar number revenue cycle leadership can stand behind.
- 2

Workforce \$210K

Model turnover costs with documentation burden as a contributing factor. Connect provider experience data to retention economics.

A working session is not a product walkthrough. It's a 45-minute conversation built around your specific profile — what the domains that haven't been measured are worth at your scale, and what organizations your size have done to move in the first 90 days.

All dollar figures apply conservative conversion rates to account for implementation variability, organizational lag, and partial capture. For Level 1 domains, figures represent benchmark ranges from similar organizations — not projections for your organization. Actual results depend on execution, market conditions, and organizational readiness. Individual results vary. Assessment date: March 17, 2026.

Dollar values shown are modeled estimates based on user-provided inputs and published industry benchmarks. Benchmark ranges for unmeasured domains are modeled estimates, not derived from a database of actual customer outcomes. Actual results depend on implementation approach, provider adoption, and organizational factors. Abridge makes no guarantee of financial results.
